Project Description: Module 2: Product Management

The E-Commerce Shopping Website is a web-based application developed to provide a convenient, secure, and user-friendly platform for buying and selling products online. The system allows customers to create accounts, log in securely, browse products, search and filter items, view product details, and add products to their shopping cart. Users can update cart quantities, place orders, provide delivery details, and complete payments through available online payment methods. The system maintains order history and provides order status information to customers.

The website also includes an Admin Dashboard through which administrators can manage users, products, categories, inventory, orders, and payments. Sales and revenue reports help administrators understand business performance and make better decisions. The proposed system reduces manual work, improves order management, and provides faster access to products and services. Overall, the E-Commerce Shopping Website aims to improve customer satisfaction while providing an efficient solution for managing online business operations.
